Canadian Data Report of Fisheries and Aquatic Sciences 1075

Pêches et Océans Fisheries and Oceans

Canada

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1–25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26–160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Abstract

The 1995 to 1998 fishing activities of a herring purse seiner in the southern Gulf of St. Lawrence are presented in summary tables and maps. The activity data was collected as part of an on-going project with the southern Gulf of St. Lawrence herring fleet to record position and acoustic signals while fishing boats are searching for herring schools during regular fishing activity. Latitudes and longitudes collected using GPS are automatically recorded to a computer file during operation of the data collection system. The recording system is activated by the vessel captain upon leaving port and is turned off upon returning to port. Fishing activity is identified as traversing (traveling to, from, and between fishing grounds), searching (searching for fish on the fishing grounds), fishing (setting the net), pumping (pumping fish into the boat), surveying (sailing over pre-determined survey transects), and other (any activities identified as not relating to the fishing activity, such as waiting in port, drifting and sleeping during daylight hours). Activities were identified using visual cues based on pattern, speed of boat, and captain logbooks. The fishing track was then divided by activity into 100m intervals and the distance and time spent during each activity was determined for each fishing trip. A summary of the activities indicated that the average number of hours for searching ranged from 5 to 15. The summer months were those with the highest average searching.

Résumé

Les activités de pêche de 1995 à 1998 d'un grand seineur de hareng dans le sud du golfe du Saint-Laurent sont présentées dans des tableaux et des cartes sommaires. Les données sur l'activité de pêche ont été recueillies dans le cadre d'un projet en cours avec la flottille de pêche du hareng du sud du golfe du Saint-Laurent visant à enregistrer la position et les signaux acoustiques des bancs de harengs au cours des recherches menées par les bateaux de pêche durant l'activité de pêche régulière. La latitude et les longitudes recueillies à l'aide du système de positionnement global (GPS) sont automatiquement enregistrées dans un fichier informatique durant le fonctionnement du système de collecte de données. L'appareil d'enregistrement est mis en marche par le capitaine du navire au moment de quitter le port et est arrêté au retour au port. L'activité de pêche est définie de la manière suivante : déplacement (se déplacer depuis et vers les lieux de pêche ou entre ces lieux), recherche (chercher du poisson dans les lieux de pêche), pêche (tendre le filet), pompage (pomper le poisson dans le bateau), relevé (naviguer au-dessus de transects de relevés prédéterminés) et autres (toutes les activités définies comme n'étant pas liées à l'activité de pêche, comme attendre au port, dériver et dormir durant les heures de clarté). Les activités ont été déterminées à l'aide d'indices visuels basés sur la configuration, la vitesse du bateau et les journaux de bord des capitaines. La route de l'activité de pêche a ensuite été divisée par activité en intervalles de 100 m et la distance couverte et le temps passé au cours de chaque activité ont été établis pour chaque expédition de pêche. Un résumé des activités a indiqué que le nombre moyen d'heures de recherche variait de cinq à quinze. Les mois d'été étaient ceux qui avaient la moyenne de recherche la plus élevée.

1. Introduction

Understanding fleet dynamics is an important part of fisheries stock assessment and management. This understanding is important to interpret data provided by the fishing fleet for stock assessments. These data may include catch rates or qualitative information on fish behaviour and abundance. Often data provided by the fishing industry is qualitative in nature or not reported in sufficient detail for the interaction of fish abundance, fishing behaviour, and fishing regulations to be studied. One of the reasons for this lack of detail is that typically only locations and amount of catch are recorded in fishing logbooks, while the time spent traveling to fish or searching for fish is not available. This report summarizes in tabular and mapping formats detailed information that was collected by a herring purse seiner in the southern Gulf of St. Lawrence. It is hoped that these data will improve interpretation of catch rate and qualitative information provided by the fishing industry for stock assessments.

2. Data description

The information collected consists of latitude and longitude determined by GPS units and recorded automatically to computer files. These data were collected as part of on-going acoustic projects with this herring fleet (Claytor et al. 1999). The hardware systems and data collection methods have been described elsewhere (Clay and Claytor 1998, Claytor et al. 1998). This system provides an objective means of collecting data. The vessel captain activates the system upon leaving port and turns it off upon returning to port. While the system is operating, positional and acoustic data are automatically recorded to a computer file.

Software processing consists of identifying the fishing activity as **traversing** (traveling to, from, and between fishing grounds), **searching** (searching for fish on the fishing grounds), **fishing** (setting the net), **pumping** (pumping fish into the boat), **surveying** (sailing over pre-determined survey transects), and **other** (any activities identified as not relating to the fishing activity, such as waiting in port, drifting and sleeping during daylight hours). Activities were identified using visual cues based on pattern, speed of boat, and captain logbooks. The fishing track was then divided into 100m intervals by activity and the distance and time spent during each activity was determined for each fishing trip (Claytor et al. 1998). FEMTO HDPS hardware and software was used for the collection and processing of the positional data prior to mapping and tabular summaries.

Tables 1 - 6 summarize the fishing activities from 1995 to 1998. The maps consist of the fishing track, with activity identified by the line font as indicated in the legend for each map. Where activity warranted a more detailed view, an inset of selected portions of the track is provided.

3. Fisheries and biology of 4T southern Gulf of St. Lawrence herring

NAFO Division 4T encompasses the southern Gulf of St. Lawrence (Appendix. 1). Herring originating in this area consist of two seasonally defined spawning components. Spring spawning occurs primarily in May but extends from April to June, at depths < 10m. Fall spawning occurs from mid-August to late September at depths from 5 to 20m. First spawning for both seasonal components occurs primarily at age 4 but 50% of age 3 herring sampled on 4T spawning grounds are in spawning condition. The largest spring spawning populations are in the Northumberland Strait, between New Brunswick and Prince Edward Island, and in the Magdalen Islands. Relatively small spring spawning populations occur in Chaleur Bay (New Brunswick-Québec), eastern Prince Edward Island, and Pictou, Nova Scotia (Appendix. 1). The largest fall spawning population is in Chaleur Bay. Smaller fall populations are found in the Northumberland Strait between New Brunswick and Prince Edward Island, eastern Prince Edward Island, Pictou, Nova Scotia, and the Magdalen Islands (Appendix. 1), (Claytor et al. 1998).

After spawning, herring form large schools in Chaleur Bay and on the north side of Prince Edward Island (Claytor et al. 1998). They remain in these areas until mid-October when they begin to migrate to eastern Cape Breton (4Vn) where they overwinter (Appendix 1). Herring return to 4T from 4Vn overwintering areas in the spring, as the ice begins to recede. Herring age 2 and less

possess anti-freeze proteins (Chadwick et al. 1990) which allows them to remain in the Gulf of St. Lawrence for the winter or migrate later in the fall to 4Vn.

Southern Gulf of St. Lawrence herring are harvested by an inshore gillnet fleet on spring and fall spawning grounds for a food and bait market in the spring and a roe market in the fall. The inshore fleet is allocated 77% of the 4T herring quota. Larger purse seiners harvest pre- or post-spawning aggregations in the spring and fall for a food market. In late fall and early winter, the purse seiners follow 4T herring into 4Vn where a fishery on the overwintering portion of the population occurs (Claytor et al. 1998).

The majority of the purse seine harvest comes from the Chaleur Bay fishery where mixed schools of spring and fall spawners are caught. The overwintering fishery in 4Vn has occurred from November 1 to mid-December in recent years and harvests primarily fall spawners. Catches are variable in the spring fishery (1000 - 4000 t), which occurs from April to June between the Magdalen Islands and Cape Breton. The purse seine fleet usually fishes as a group and so the fishing area and activity of one boat is representative of the fleet (Claytor and Clay 2001).

4. Use in stock assessments

Using fishing activity data combined with biomass estimates from acoustic soundings recorded by the purse seine vessel indicates that catch per meter searched is linearly related to density (Claytor and Clay 2001). As a result, these data represent the basis for an abundance index derived from purse seine fishing activity. This result is important because it has generally been observed that catch per set by purse seiners is not indicative of abundance. Although these data are more time consuming to collect than catch per set information, they have the potential to greatly improve stock assessments by contributing an abundance index that has not previously been available.

5. Acknowledgments

The authours would like to express their thanks to the captain and crew of the Gemini. They often went out of their way to facilitate our requests and voluntarily collected these data from 1995 to 1998. We would also like to thank Kelly Trenholm, Jocelyne Bourque and Danny Leger for their assistance in editing the tables and maps. Funding for this project came from the National Hydroacoustic Program, HRD Science Intern and Career Edge programs, and DFO regional budgets.
